

### Machine Learning Model Detection

You implement detection based on Machine Learning. Choose another player: until your next turn, attacks from that player to your clusters have no effect.

### Replicated Backups

A good backup policy saves you from disasters. Pick one cluster from the destroyed clusters pile and put it in your cloud.

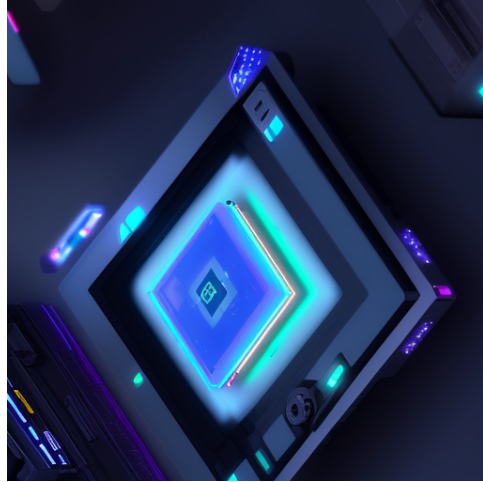

### MFA

You enforce Multi-Factor Authentication on all your cloud accounts. You may draw two cards.

### Cloud Migration

Your infra team has managed a migration to another cloud provider. You can exchange one of your cluster cards for one of another player.

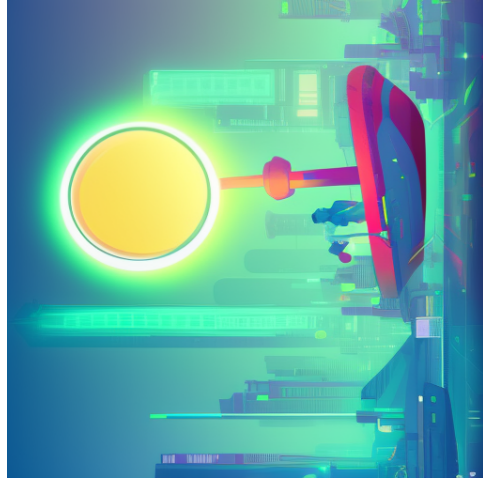

### Image Scanning

You scan all the images of your containers. You may look at the cards in target player's hand, and at up to one of target player's hidden clusters.

### Cloud Best Practices

You follow the best practices and read the manuals. If you have no techs deployed, draw two cards.

### Container Forensics

You have better skills now to perform forensic analysis in your containers. Skip the draw step; until your next turn, prevent all damage to your clusters.

### External Audit

With the help of an external auditor, you passed several security compliance tests. Until your next turn, your clusters can't be destroyed.
